

🚩 Current Skill Adding JavaScript to a Web Page

Adding JavaScript To a Web Page

In HTML, JavaScript code must be inserted between starting and closing `<script>` tags.

In this example we'll be creating an HTML element using JavaScript to display an alert welcoming the user.

Scripts (such as this one) can be placed in the `<head>`, just before the closing tag of the `<body>` section of an HTML page, or in both.

PS : It's highly recommended that it is inserted right before the `</body>` tag, so that the page can load all the other HTML elements before the JS.

```
<script language="javascript">
alert("Hello there random user! :)")
</script>
```
