Update Document 📄

db.collection.save()

Updates an existing document or inserts a new document depending on the document's parameter.

The save() method uses either the insert or the update command, which uses the default write concern. To specify a different write concern, include the write concern in the options parameter.

```
db.collection.save(

    <document>,

    {

      writeConcern: <document>

    }

)
db.products.save( { item: "book", qty: 40 } )
```

- **document:** the document to be saved to the collection.
- **writeConcern:** Write concern describes the level of acknowledgment requested from MongoDB for write operations

Note: MongoDB rejects the db.collection.save() method. Instead use db.collection.insertOne() or db.collection.replaceOne() instead.
