Columns and Rows

First we have to define columns and rows, because a grid without them is entirely pointless.

To create columns and rows within a grid container you use these two new CSS properties: `grid-template-columns` and `grid-template-rows`.

So how do you use them? Pretty simple.

`grid-template-columns` determines the placement of the columns while `grid-template-rows` determines the placement of the rows within the grid container.

All we need to do is type in the length of these properties,

- CSS

```
.grid-container {
  display: grid;
  grid-template-columns: 100px 200px 300px;
  grid-template-rows: 100px 200px 300px;
}
```
