External JavaScript

We can also place scripts in external files. This is practical when the same code is meant to be used by different web pages and, most importantly, for respecting the "Separation of Concerns" design principle.

Thus, we will keep our HTML files for structures and our logic part will be kept in files of their own. In our case, they will be JavaScript files that will have the extension .js.

To be able to use these external scripts we'll put the name of the script file in the src (source) attribute of a `<script>` tag like this:

PS: The script will behave as if it was located exactly where the `<script>` tag is located.

```
<script src="myScriptFile.js"></script>
```
